Forward

Explanations

Written by: *Steven Christopher Sheppard (submarine navy veteran/"write-in" candidate for Republican Governor of Maine 2026)*

No one in my family or neither one of my good friends have ever been able to completely understand what I have to antipole or counterpole.

I joined the military through recruiter in Satellite Beach, Florida around 1990; I volunteered myself to the USN as a submarine electronics technician.

In college at Tiffin University in Tiffin, Ohio I had studied all essential curriculum for my freshman year. I studied science, law, management and computer programming BASIC. After my freshman year in college I was complete enough. I had already realized that I was in a good pattern or a "habit" studying without being told to study. College was slow and the curriculum uninteresting.

My freshman year in college at Tiffin University in Tiffin, Ohio taught me well enough. The age of computers was coming fast in 1987; the “personal computer” nor the handheld mobile phone had evolved enough for the average consumer to own.

After my college freshman year I returned to Orlando, Florida and started working with my father’s company Engine Tech.

The Gulf war broke out on television and Saddam Hussien was verbally expressing hate by admitting “all Americans must die!” The high levels of authority in Iraq and Saddam Hussien made me want to fight through USN. My grandfather Carl Hixon Hill (died in 2008) was a navy veteran of WWII; my grandfather became a machinist later and retired from the Michelin tire company in Greenville, SC as a quality control clerk.

After recruitment was resolved and I was completely tested at MEPS in Jacksonville, FL, I was flown to Great Lakes bootcamp in Illinois. I enjoyed my time in bootcamp and was stressed just a little bit from all the work out routines. I had played football in college at Tiffin University and I was completely confident with exercises as a navy recruit and young man.

I finished bootcamp and was married in Cocoa Beach to my first darling wife.

Then I flew up to Groton, CT at the submarine school; submarine school was also much more entertaining than college.

In Groton, CT I could study and test above 98 percent of the student classes I encountered; I was at the top of my class all the way through submarine school in Groton, CT.

I studied “nuclear energies” and how energy is basically designed to function onboard a submarine. The knowledge I know is most likely classified some now and I will not proceed from this point and focus.

In enjoyed mechanics and mechanical mechanisms such as the type-18 periscope and also how to operate the submarine device enough to troubleshoot with oscilloscope and modern instrument.

I learned very fast and tested out nicely to become a petty officer 3rd class ET3.

I know how nuclear energy works.

I also lived in Salt Lake City, Utah during my time in the western states. I found that water in Utah was so extremely alkaline that I couldn't focus any longer and I moved back east in 2016.

In Utah...there are companies and other organizations that seem to be hiding the truth about nuclear waste disposal. Nuclear waste north of Salt Lake City boasts mental illnesses. Mental illness is a product of the deep knowledges of nuclear energy and the components there of everywhere I had traveled and lived.

After living in Salt Lake City and Reno, Nevada, I knew there was a statistical amount of atomic troubles that seems to stem from the bi-products of nuclear wastes.

My mind had become sensitive to nuclear energy and the way good extractions of mineral ionized properly to qualifying metal plate. Those plates were burning hot at times where nuclear waste propagate inward, outward, sideward and to unknown dimensions there somewhere around Utah in the west.

Nuclear energy was hurting me; radon and other non violent gases were just part of the building structures; radon was radical and hot inside a warm room during the winters. Radon especially was coming up from the fissures and the collapsing abyss along the lines of the Uinta Wasatch mountain chain and ridgeline symmetry. Quite simply- Utah was atomically hot down closer to the copernicium chambers; where the synthetics of copernicium were a bi-product of elemental and periodic atomic acceleration through

completed absorption inside the earth under Utah. The positive isotopes of protactinium are absorbed naturally down inside the mantle in Utah where water aquifers share displacement with mineral and elements inside the earth beneath Utah. The heat from the radioactive waste was “sinking” or being “absorbed” down to the core elements of lithium, beryllium, iron and zinc under the symmetry of the Uinta Wasatch mountains that run perfectly north to south; then peaking at Alta, Utah where all the heat and elemental displacement of radical energies and synergies were coming to a phenomenal conclusion. The atmosphere then absorbs these escaping radical gases as they divide again and again into outer space where protactinium is absorbed by each component in each place that can stabilize these new earth radical and synthetic gases through deep outer space or shallow outer space absorption of radical earth isotopes.

The entire nation, the complete plate of north America divides into four major quadrants of geology and zodiac there in Alta, Utah where all the noises, all the pain and mental illnesses associated with nuclear waste energy had been recycle by the center of earth beneath Utah. All the radical energies coming up from the deposits of magnesium closer to the earth’s center help those radical nuclear wastes of synthetic copernicium and protactinium. Radical and better radicals escape into the sky and into outer space as perfectly enough when radical isotopes of nuclear energy extraction are dumped or exposed onto the natural ground in America.

Nuclear waste becomes synthetic types of protactinium and other forms of copernicium when they reach negative bias maturity one way and down below the mantle until the wasted ions reach magnesium and are developed into a synthetic and intrinsic type of toxic gas that escapes the earth in order to “fix” or “heal” the atoms radical incompleteness from the burning hot and burning hard nuclear energy applications.

Vote no!

No to nuclear energy in Maine is the only good answer. Any nuclear energy component either wasted or dumped by accident or by authority stored

perfectly and contained will express our chromosomes through radical and disturbing expressions. All this atomic corruption on Earth disturbs genetic harmony and balance of life and quality of life in every living thing of Maine.

Vote no!

No nuclear energy in Maine is the solution to further expensive and complicated problems with mental illnesses that also are a great by product of nuclear energy.

Vote no!

By Democrat Senator of Maine- Henry Ingwersen - York
"An Act Regarding Access to Behavioral Health Supports for Adults with Certain Disabilities"

I am a submarine navy veteran ET3 of the Gulf War.

I am also a "write-in" Republican candidate for Governor of Maine 2026 so far as I know. I am registered with Ethics Commission and I am on the ballot for 2026.

Over the years I especially have managed a certain type of "mental illness". I take medicine and I am healthy, but I need council at times now more than ever. I have VA veterans' affairs and that much helps.

I know now that intelligent veterans like myself are being profiled and discriminated upon for these modern psychological complications. My unique blend of thinking is smart! I was trained by the submarine navy to manage nuclear or other types of war. Veterans and other intelligent kinds of men and women cannot rely on public health systems to council.

I have found that intelligent men need a "body" or a "committee of councilors not just one at a time.

There needs to be an institution where only certain kinds of helpful doctors and nurses convene to help council men and women managing "modern psychological experiences" MPE.

Our modern psychological experiences are harder than ever now.

The issues of nuclear energy and the way radical energies are stored and dumped or hidden or abused is unlawful for some of us.

The new Task Force Council or TFC is strictly for mental issues and not for the general public to abuse or mistreat.

The TFC would have certain guidelines and policies for hostile or rude behaviors when they are convening to try and help talk through issues.

I had a breakdown in 2024 because one of my doctors at VA is Jewish and the war with Ukraine and Israel was making me upset.

I needed to speak to someone other than a Jewish doctor that doesn't really seem to care that much for me.

As with Romans- the "council" as in the plural needs to help; no more does one doctor at a time help intelligent men with mental illness issues.

The new Task Force Council is strictly for helping discuss modern issues that are frightening, upsetting and even harming American elites and other intelligent forms of American leadership.

I have found that elite Americans need a Task Force Council of some design to actually help more better than just one council or one doctor at a time.

*Attached to this testimony is another attachment I have written for the issues with nuclear energy- LD 342.

I have included my story about why LD 342 is significant to me now.

Nuclear energy effects mental health in intelligent people exposed to high or even low levels of radiation.

Story attached.

Vote Yes! To ensure a new and modern TASK FORCE COUNCIL may be a possible solution in the future.

I love Maine!
