In the 21st century, as our climate accelerates and changes the task of reducing air pollution and greenhouse gases is becoming more urgent.

With a foundation of science and what we see happening before our very eyes -- every year is hotter than the year (year after year!), we need to take action.

One way to mitigate the climate change crisis is to invest in clean energy transportation, an investment that will allow Mainers more options for travel. Cars and trucks spew air pollution and more mass transit is a proven way to reduce traffic. Common sense in addressing a looming crisis is paramount. Please invest in clean energy transportation, a move that will have lasting effects well into the future.
