Dear Committee,

As a former biology and physics teacher I believe it's inescapable that the planet is rapidly heading into an existential crisis generated by use of fossil fuels.

With each succeeding scientific review of the data the prognosis is more serious.

The science is clear! The remedy is before us and practical; stimulate a move away from fossil fuel use to renewables which are already often less costly.

Only if the true cost of fossil fuel use is placed on the fuel providers will the economics stem their production. Please support this legislation.

Thank you for your understanding of this situation.
