I think it's important to remember that most vaccines have a time period where they are under surveillance to see if there are any negative effects to the children's health. We already know if some complications. Let's notice that kids affected by covid are not deathly and that we should be watching for what implications the vaccine may have on reproduction and other adverse reactions. Let's vaccinate all the adults and let us be the test subjects. I am vaccinated and have had major issues with my typically regular cycle since getting the vaccine.

Thank you for hearing me out. We are in this together.
