

Nina Krentel  
Plymouth

As a young woman of child bearing age, I am extra aware of the importance of minding my health and well-being. I extensively research everything that I put into my body, making sure that it is clean, natural, and proven to be safe. That is why I am FOR this bill, which will protect people from being forced to take an experimental drug that could potentially harm their fertility or their unborn babies.

Enforcing a vaccination that has undergone so little safety testing is so counter to all of the care and precautions that we usually take when it comes to reproduction and childbearing in our society. With even the CDC admitting recently that the Pfizer vaccine has been connected to fatal blood clots, it has become even more important that we do more research before we force this onto our community. To create mandates that could potentially rob people of their fertility and even their life is dehumanizing to say the least and even alludes to darker days of eugenic experiments.

Children represent the future of our society and bringing healthy children into it is an incredibly important role that must not be forcibly taken from anyone just as it should not be forced upon them. If we are to continue to call ourselves a free country we must allow people the choice of what to put into their bodies.
