

My name is Dr. Sherman Hom and I am the Director of Regulatory Affairs for Medicinal Genomics Corporation.

I would like to address a previous comment that was made by the person who stated that all the microbes are destroyed via combustion, which is the primary route of administration.

I would like to point out that when a person smokes a self rolled joint or a pre-roll, I agree that the microbes at the point of combustion are destroyed, BUT room temperature vapor is drawn through a cannabis joint or a preroll into a person's respiratory tract. This vapor contains dangerous molds, such as the spores of *Aspergillus* human pathogens that I have already described. Therefore this previous observation is not correct and the *Aspergillus* pathogens should be added to your compliance list.

I hope that you pass this bill.
